It currently consists of 17 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Center: Washington University Genome Sequencing Center

The invention relates to a polynucleotide (I) comprising a fragment of a sequence upstream of the coding part of the gene for the Cardiac Ankyrin Repeat Protein (CARP). (I) is capable of inducing a specific expression in vivo of a gene operably linked to (I), in cardiac cells. (I) or a vector (IIb) comprising (I) is useful for the manufacture of a medicament intended for the treatment of cardiac insufficiancy, cardiac hypertrophy and hypoxia, and for preventing rejection during cardiac transplant. An expression cassette under the control of (I) is useful for encoding a protein or RNA which is capable of activating the growth of cardiac cells, reducing or suppressing an immune response, inducing angiogenesis, correcting muscle contractility, cardiac hypertrophy, cardiac cardiac correcting muscle contractility. (IIb) is useful for expressing a gene of therapeutic interest in vivo, by isolating (IIb) and introducing (IIb) in the cardiac tissue, under conditions so that the gene of interest is expressed. (I) the vectors and the compositions are useful in clinical, expressed. (I) the vectors and diagnostic fields, and in the treatment and prevention of cardiac pathologies. (I) is also useful for generating transgenic animals which constitute models for studying certain cardiac prevention of cardiac pathologies. (I) is also useful for generating molecules for their activity on the regulatory sequences of the gene encoding the CARP protein. The prasent sequence represents the DNA fragment upstream of the coding sequence of a mouse CARP protein. sequence of a gene for Cardiac Ankyrin Repeat Protein, for controlling the level and specificity of expression of a transgene in cardiac muscle cells 1; Fig 1; 48pp; English Claim

The invention relates to a human type-5 recombinant adenovirus vector for achieving cardiac-restricted transcription of a gene of interest. The vector comprises inverted terminal repeat (ITR) sequences from human adeno-associated virus (AAV) type 2 (AAAI0405) and a cardiac tissue-specific promoter. In particular, the promoter is that of the cardiomycoyte-restricted cardiac ankyrin repeat protein (CARP) gene. The adenovirus vector is used for targetted gene therapy for heart disease and for evaluating gene function. Cardiac restricted transcription of a transgene in both neonatal and mature cardiac tissues can be achieved to treat inherited and acquired heart diseases. The vector is suitable for tissue-specific use in vivo and in vitro and provides cardiac restricted transcription. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     TICAGGATCAGCCTGATTCTAGGGCAGCAGTTCTCAACCTGGGGGCCTCGACCCCTTTGG 270

The invention relates to a polynucleotide (I) comprising a fragment of a sequence upstream of the coding part of the gene for the Cardiac Ankyrin Repeat Protein (CARP). (I) is capable of inducing a specific expression in vivo of a gene operably linked to (I), in cardiac cells. (I) or a vector (IIb) comprising (I) is useful for the manufacture of a medicament in tended for the treatment of cardiac insufficiency, cardiac hypertrophy and hypoxia, and for preventing rejection during cardiac transplant. An expression cassette under the control of (I) is useful for encoding a protein or RNA which is capable of activating the growth of cardiac cells, reducing or suppressing an immune response, inducing angiogenesis, correcting muscle contractility, cardiac hypertrophy, cardiac correcting muscle contractility. Cardiac hypertrophy, cardiac of the cardiac correcting correcting contractility. (IIb) is useful for expressing a gene of the cardiac interest in vivo, by isolating (IIb) and introducing (IIb) in the vectors and the compositions are useful in clinical, expressed (I), the vectors and diagnostic fields, and in the treatment and prevention of cardiac pathologies. (I) is also useful for generating cranspenic animals which constitute models for studying certain cardiac prevention of pathologies. (I) is also useful for screening concluding the CARP protein. The present sequence represents the DNA fragment upstream of the coding sequence of a human CARP protein.
                                            New promoter sequence derived from a portion upstream of the coding sequence of a gene for Cardiac Ankyrin Repeat Protein, for controlling the level and specificity of expression of a transgene in cardiac muscle cells
                                                                                                                                                                                             Claim 5; Fig 2; 48pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, nematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaenia; nervous system disorders; arthritis; inflammation; ss.

the present sequence to that the grace antername and the present sequence to the murine gastrokine group, designated antrum mucosal protein 18 (AMP-18). AMP-18 was initially detected in mammalian gastric antrum mucosa by a differential screen of CDNA libraries obtained from different regions of the pig stonach. A CDNA was also isolated from a mouse library (see ABZ24608). Genomic AMP-18 DNA sequences were subsequently cloned as a prelude to the analysis of gene regulatory elements. AmP-18 protein is expressed at high levels only in the gastric antrum, and is synthesised in the lumenal sufface mucosal cells. Partially purified AMP-18s from mouse and pig antrum tissue are mitogenic to confluent stomach and kidney epithelial cells in culture. This effect is inhibited of y specific antisera, suggesting that AMP-18, role in the repair of the stomach epithelium following damage by agents such as alcohol. Conservice by protein and reconstruction and reconstruction and reconstruction following damage by agents such as alcohol. Conservice principle of AMP-18, cancers. AMP-18 protein, or an active peptide of AMP-18, is used in a claimed method of stimulating the growth of epithelial

                                                                                                                                                                                                                                                                                                                                                                                                                                           exon
 tissues and their corresponding proteins. The invention also relates to methods for assessing the expression level of these genes. The method is used for testing the predisposition of mammals and preferably humans for a heart disease or for an acute state of such a disease. The method useful to treat disease of the heart such as congestive heart failure, dilative cardiomyopathy, hypertrophic cardiomyopathy, ischaemic cardionomyopathy, specific heart muscle disease, thythm and conduction disorders, syncope and sudden death, coronary heart disease, systemic arterial hypertension, pulmonary heart disease, valvular heart disease, congential heart disease, pericardial disease and endocarditis. Sequences of the invention are also used in gene therapy. A transgenic non-human mammal comprising the sequences of the invention are useful for the development for medicaments for the treatments of heart diseases. The present DNA sequence is expressed sequence tag

The invention relates to a protein inhibitor which comprises homologous cellular growth stimulating proteins designated gastrokines. The invention also provides gastric antrum mucosal proteins designated AMP-18 which belongs to the novel group of gastrokines and nucleic acid molecules encoding such proteins. Pharmaceutical composition comprising growth stimulating peptide derived from a gastrokine protein is useful for treating gastro-intestinal disorder or diseases associated with overgrowth of gastric-intestinal disorder. The invention is useful in cell therapy. The present sequence is mouse pre-AMP-18 gene.

The invention describes an isolated nucleic acid molecule encoding
               gene product that, when knocked out, results in a high growth (hg) phenotype. For example a nucleic acid disrupting the Socs2 gene is unseful for producing an animal characterised by a hg phenotype, by inhibiting expression of Socs2 (supressor of cytokine siganling 2) gene. The nucleic acids of the invention are useful for regulating body size in mammals. gene. The nucleic acids of the invention are useful for regulating body size in mammals. This sequence represents the mouse high growth region.

Note: This sequence did not form part of the printed specification but, was obtained in electronic format directly from the US patent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Neuron-specific transcription; promoter; mouse; Presenilin-1 gene; transgenic; laboratory model; Alzheimer's disease; ss.

                                                                                                                                                                                                        The invention relates to novel drug compositions for the treatment and prevention of disorders of food intake and body weight containing as the active component histamine receptor H3 protein, or DNA encoding it, or an agonist to it. A composition of the invention has anorectic activity. Compositions containing the histamine receptor H3 protein may be used in the treatment and prevention of disorders of body weight and food intake. The present sequence represents the mouse histamine receptor

The method is useful in drug development, particularly for conducting toxicity studies and analysis before a new drug or compound is approved for human consumption or use. The method is also useful in determining toxicological responses to a new drug. This polynucleotide sequence represents a phase-1 rat CT gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    determining toxicological responses to a new drug, by determining the expression of rat toxicologically relevant genes in the test animal in

For example a nucleic acid disrupting the Socs2 gene is useful for producing an animal characterised by a hg phenotype, by inhibiting expression of Socs2 (supressor of cytokine siganling 2) gene. The nucleic acids of the invention are useful for regulating body size in mammals. gene. The nucleic acids of the invention are useful for regulating body size in mammals. This sequence represents the mouse high growth region.

Note: This sequence did not form part of the printed specification but was obtained in electronic format directly from the US patent

The specification describes a non-human transgenic mammal comprising a genome containing a single copy of a wild-type WFS1 gene and a modified WFS1 allele containing a must disrupts the function of wolframin, or its transgenic progeny. Wolframin is a predicted transmembrane protein expressed in many tissues including pancreas and brain. The transgenic nonhuman animals are useful as models for depression, particularly as models for depression in humans. The animals exhibit chronic stress-induced neurochemical and behavioural changes associated with depression. The transgenic animals are also useful for screening or identifying antidepressant agents, drugs or genes that may be employed to ameliorate or treat depression. The animals are also

The present invention describes nucleic acid sequences isolated from rat. The sequences of the invention comprise 70 viral infection (VI) genes and 8 tumour suppressor (TS) genes. Propagating cell cultures in the absence of the serum protein (SP) allows selective elimination of cells persistently infected with a virus from the cell culture. Inhibitors of the SP can be used for reducing or inhibiting a viral infection. Inhibitors of the TS gene products can be used to suppress a malignant phenotype (MP). The methods and inhibitors can be used with viruses such as HIV, influenza, hepatitis virus or animal retroviruses such as simian immunodeficiency virus, avian immunodeficiency virus, bowine immunodeficiency virus, feline immunodeficiency virus, equine infectious

Sequence 38, Application US/08882164D

Patent No. 6306624

Patent No. 6306624

Patent No. 6306626

APPLICANT: Petkovich, P. Martin, White, Jay A.,

APPLICANT: Beckett, Barbara R., Jones, Glenville

TITLE OF INVENTION: Retinoid Metabolizing Protein

NUMBER OF SEQUENCES: 43

CORRESSEDNIBRICE ADDRESS:

ADDRESSED BLAE, Commerce Court West

CITY: Toronto
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            7035 TCACACACATCAGGAAGGTAGA 7013

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence Sequence

Computerional Anialysis of Full-Lenguin Mouse Curhas Computer with Human Genome Sequences Mamw. Genome 12, 673-677 (2001)

Normalization and subtraction of cap-trapper-selected CDNAs to prepare full-length CDNA libraries for rapid discovery of new genes. Genome Res. 10 (10), 1617-1630 (2000)

RIKEN integrated Sequence analysis (RISA) system--384-format sequencing pipeline with 384 multicapillary sequencer. Genome Res. 10 (11), 1757-1771 (2000)

Computer-based methods for the mouse full-length CDNA encyclopedia: real-time sequence clustering for construction of a nonredundant cDNA library. Genome Res. 11 (2), 281-289 (2001) cDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN. Division of Experimental Animal Research in Riken contributed to prepare mouse tissues.

The sequence contained an oligo-dT track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NotI site and the oligo-dT track served to identify it as a clone from the

cDNA Library Preparation: M.B. Soares Lab Clone distribution:
clones will be available through Research Genetics (www.resgen.com)
This clone is also available through the I.M.A.G.E. Consortium at
LLNL (info@image.llnl.gov). IMAGE ID= 1790595 The following
repetitive elements were found in this cDNA sequence: 45-167,
Seq primer: M13 Forward.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Rattus norvegicus

The sequence contained an oligo-dT track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NotI site and the oligo-dT track served to identify it as a clone from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Bonaldo,M.F., Lennon,G. and Soares,M.B.
Normalization and subtraction: two approaches to facilitate gene
present between the Not I site and the oligo-dT track. The library was constructed as described by Bonaldo, Lennon and Soares, Genome Research 6: 791-806, 1996. Tissue provided by Jim Lin, Department of Biology,
                                                                                                                                                                                                                                                                                              CTGGAGTCACATATCATCTATCTATATCAAATATTCACATCATGACTCATAACAGTA

The sequence contained an oligo-dT track that was present in the oligonuclectide that was used to prime the synthesis of first strand CDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the CDNA between the NotI site and the oligo-dT track served to verify it as a clone from the normalized ventricle at 13 dpc library CDNA bibrary Preparation:

M.B. Soares Lab Clone distribution: clones will be available through Research Genetics (www.resgen.com) The following repetitive elements were found in this CDNA sequence: 1-43,

library is a subtracted library derived from the UI-R-B40
UI-R-AB1, UI-R-AC1, UI-R-AD1, UI-R-AB1, UI-R-AF1, and
UI-R-AG1 libraries. These libraries represent tissues from
rat atrium at 16.5 dpc, ventricle at 16.5 dpc, AV canal
at 16.5 dpc, atrium at 15 dpc, ventricle at 13 dpc. AV
canal at 15 dpc, and ventricle at 13 dpc. The tag is a
string of 5-6 nucleotides present between the Not I site
and the oligo-dT track. The library was constructed as
described by Bonaldo, Lennon and Soares, Genome Research
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AATGTCTTGTACTGAAGATTCTAGAACACACATTTGCTGGTTGAACAGCTGAAGTGGGGGT 1058

The sequence contained an oligo-dT track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NotI site and the oligo-dT track served to identify it as a clone from the normalized ventricle at 13 dpc library cDNA Library Preparation: M.B. Soares Lab Clone distribution: clones will be available through Research Genetics (www.resgen.com)
                                                                                           1 (bases 1 to 511)

The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel

of pWD42 (gi|473114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli Xii0-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AQ480395 11-236B22.TV RPCI-11 Homo sapiens genomic clone RPCI-11-236B22

Clones are derived from the mouse BAC library RPCI-23. For BAC
library availability, please contact Pieter de Jong
(pieter@dejong.med.buffalo.edu). Clones may be purchased from
BACBAC Resources (http://bacpac.med.buffalo.edu/orderingframe.htm)
or from Resea ch Genetics (info@resgen.com). BAC end page:
http://www.tigr.org/tdb/bac.ends/mouse/bac_end_intro.html
/note=Torgan: Kidney/Brain; Vector: pBACe3.6; Site_1:
BCORI; Site 2: BCORI; Female C57BL/65 mouse kidney and/or
Brain genomic DNA was isolated and partially digested
with a combination of EcoRI and EcoRI Methylase. Size
selected DNA was cloned into the pBACe3.6 vector at the
BCORI sites. The ligation products were transformed into
BH10B electrocompetent cells (BRL Life Technologies).
